1.5 Design and mode of operation

The basis of this transmitter is a piezo-resistive sensor element. The pressures to be measured directly act on a silicon diaphragm equipped with piezo-resistive resistors. Changes in pressure generate proportional changes in resistance, which is evaluated by the device's electronics and transformed into signals on the optional display, and converted into an output signal.

The output signal, which is optionally available as a current or voltage signal <sup>(1)</sup> can be dampened, spread and inverted. Configuration is realised via a Transmitter PC Interface (EU03) that is available as an accessory.

4 digit LCD	-9999 ... +9999

## NOTICE

### 4 digit LCD

In 4-digit display resolutions, the display resolution may be larger than the measuring resolution (approx. 3500 digits). This may cause an unsettled display.

2.7.2 Operating interface

The device does not have a keyboard; this means that the customer can only configure it using the Transmitter PC Interface EU03 (accessory).

Parameter	Value range
Attenuation	0.0 ... 100.0 s (jump response time 10 / 90 %)
Zero-point window	$\pm\frac{1}{3}$ basic measuring range <sup>(0)</sup>
Unit	bar, mbar, Pa, kPa, psi, InWC, % <sup>(1)</sup>
Offset	$\pm\frac{1}{3}$ basic measuring range
Measuring range start/end	Within the basic measuring range <sup>(2)</sup>
Measurement range characteristic curve	Linear, max. turn down 4:1, inverted, rooted, table
Free unit	-9999 ... +9999
Measuring range start/end	

- <sup>(0)</sup> This value defines the range around the zero-point in which the measured value is set to zero, e.g. for creep flow suppression.
- <sup>(1)</sup> The unit '%' refers to the measuring range defined by the start of the measuring range (0%) and the end of the measuring range (100%).
- <sup>(2)</sup> This only impacts on the output signal. A falling characteristic curve is possible, if the start of the measuring range > end of the measuring range.
